

# The Syntax and Semantics of German Emotion Verbs

Simon Masloch, Ruhr-Universität Bochum

simon.masloch@rub.de

BACKGROUND

GOALS

NORMAL ORDER

BINDING

INTRODUCTION

DONE

TO DO

- Since (Postal 1971), linguists have amassed a plethora of aspects in which emotion verbs are special (Landau's (2010) 'psych properties'), e.g. restricted passivisation possibilities, unexpected binding options
- Following Belletti & Rizzi (1988) the verbs are usually grouped based on their linking properties ((1–3))
- Theoretical explanations for peculiarities: 1. syntactic (cf. (4)), e.g. Belletti & Rizzi 1988, Landau 2010), 2. semantic (e.g. Arad 1998, Dowty 1991), 3. combination of 1. and 2. (almost everyone to some degree), 4. deny existence (e.g. Grafmiller 2013)
- Often, even the data is under discussion: Authors disagree when they use the same diagnostics  $\Rightarrow$  experiments needed
- Perform experiments on the syntactic and semantic behaviour of German experiencer-object (EO) emotion verbs
- How can their behaviour be explained? Is there a need to propose a peculiar syntactic representation? Do the verbs even form a coherent group (cf. Hirsch 2018)?

- (1) Der Student mag **das Thema** (experiencer-subject (ES))
- (2) **Das Thema** begeistert den Studenten (accusative experiencer-object (acc-EO))
- (3) **Das Thema** gefällt dem Studenten (dative experiencer-object (dat-EO))

- (4) Belletti & Rizzi (1988:293) for Italian (D-structure)

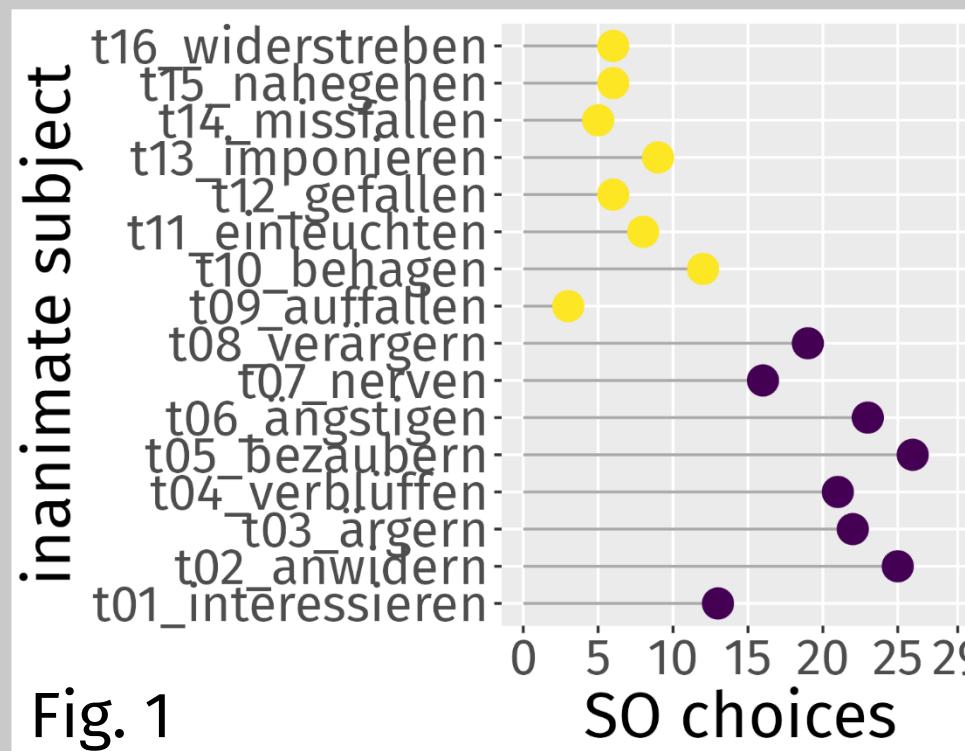

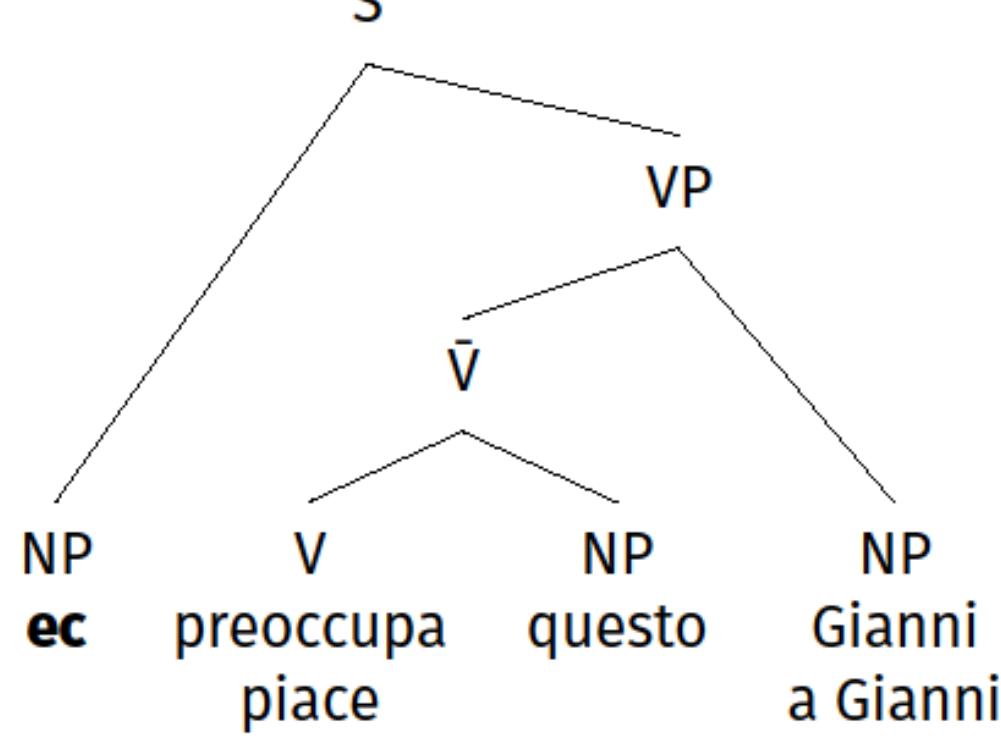

Fig. 1

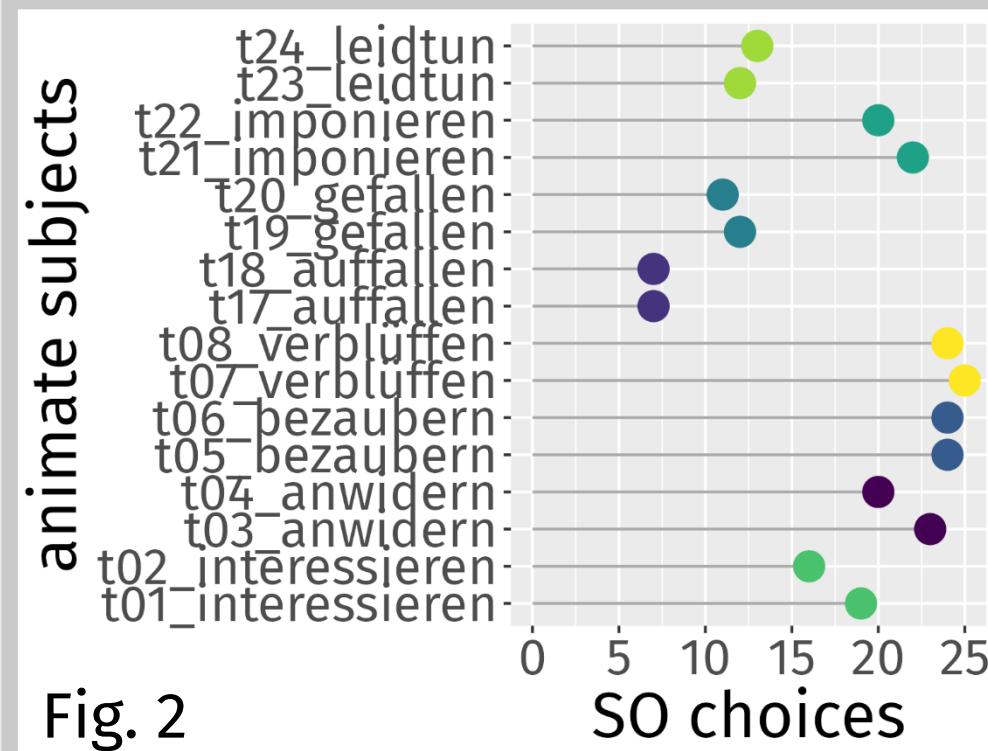

Fig. 2

What is the normal order of arguments with German EO verbs? Subject < object (SO) or object < subject (OS)

- Literature (e.g. Lenerz 1977, Haider & Rosengren 2003, Fanselow 2003, Temme & Verhoeven 2016): Disagreement over acc-EO, OS for
- 2 Forced-Choice experiments (inanimate/animate subject). Experiment with animate subject also contains action verbs, which behave as expected (always SO).
- All other factors influencing order controlled for, items like (5). Participants choose preferred variant.

- (5) Was hat Sarah gehört? Sarah hat gehört, dass {ein Trainer einem Sportler | einem Sportler ein Trainer} imponiert hat.

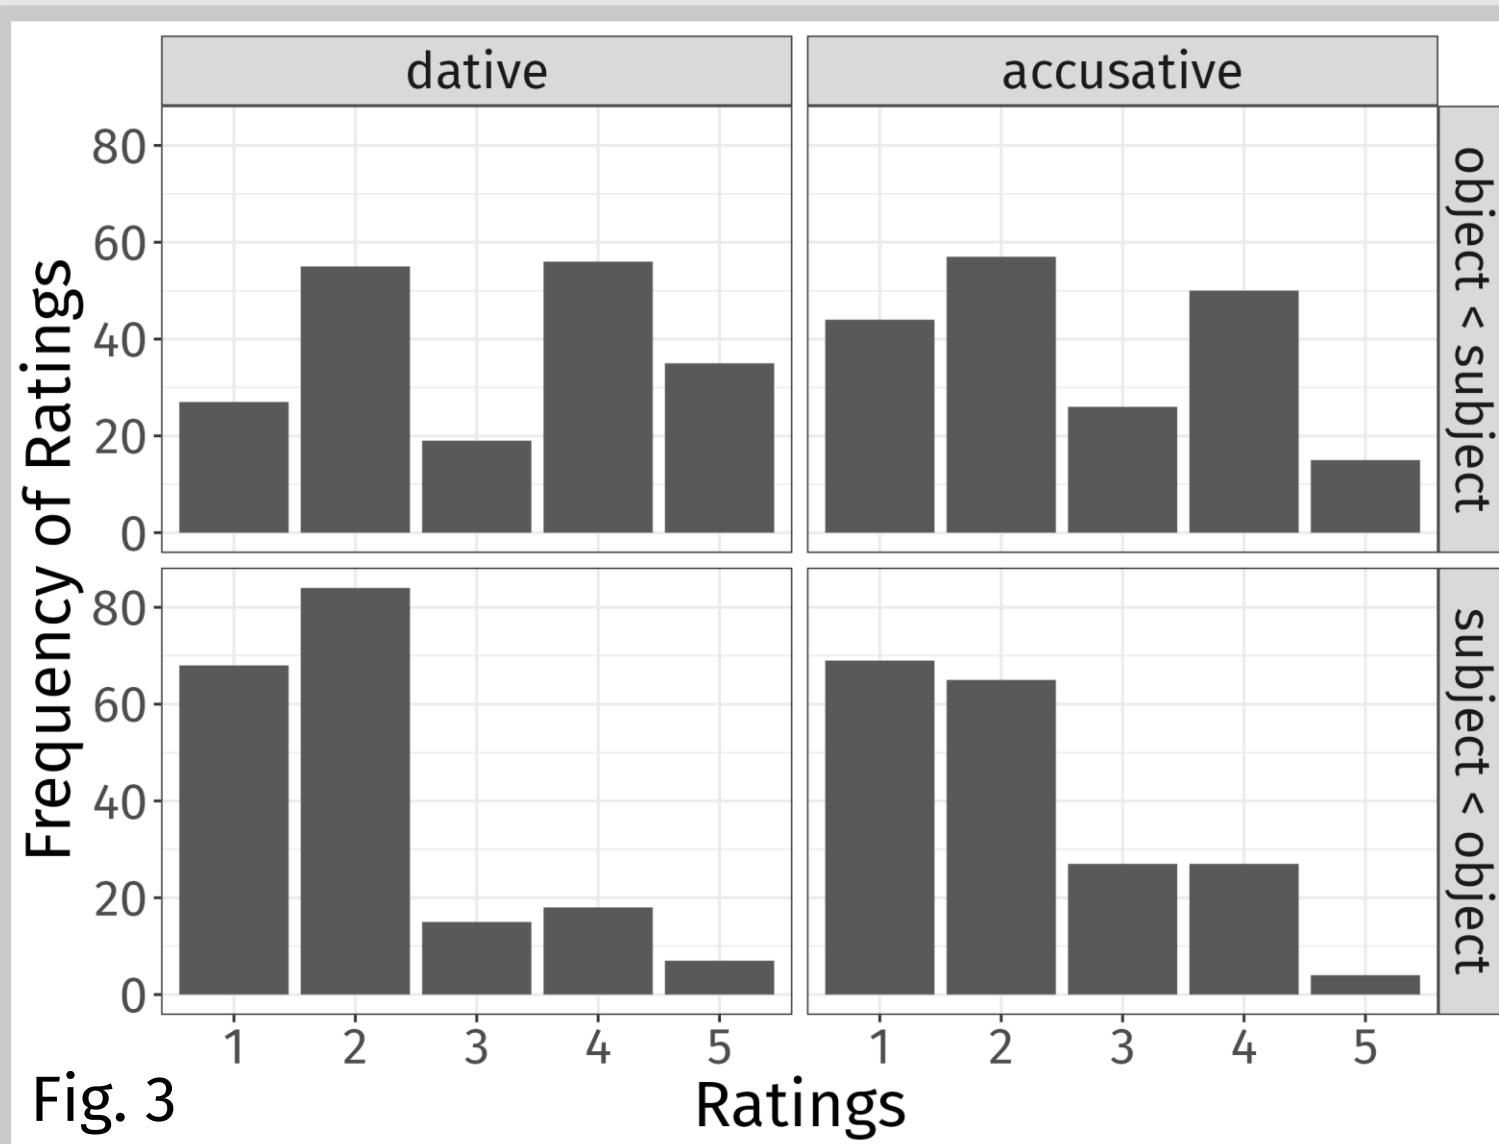

Fig. 3

- Results: inanimate subjects (fig. 1): dat-EO primarily OS, acc-EO primarily SO. Variation; animate subjects (fig. 2): acc-EO primarily SO, dat-EO no tendency. Verb-specific variation
- Analysis: No functional heads in midfield between V and C, binary-branching verbal projections, head-final (Haider 2010)
- Violable linear precedence rules modelled as weighted constraints
- Relevant here: ActorFirst, CauserFirst, AnimateFirst
- With most acc-EO verbs, the subject is a causer, with most dat-EO verbs not (but an object of emotion, cf. Pesetsky 1995)

- Acceptability-Judgement Task: Is reflexive binding into the subject of EO verbs possible in German as Belletti and Rizzi (1988) claim for Italian?
- (6) a. [...], dass das Gerücht über sich den Professor genervt hat.  
b. [...], dass den Professor das Gerücht über sich genervt hat.
- Only if the reflexive is c-commanded by its antecedent!

## Scope

- Theories of the syntax of EO verbs and theories of word order in German make predictions for the possible interpretation of sentences like the ones in (7) when combined with a theory of scope (e.g. Frey 1993, Bobaljik & Wurmbrand 2012)
- (7) a. Es hat genau ein Rocksänger jedem Jurymitglied gefallen.  
b. Es hat jedem Jurymitglied genau ein Rocksänger gefallen.
- Test these predictions in a Truth-Value-Judgement Task

## Intensionality

- Cheung and Larson (2015) and Cosma & Engelberg (2014) discuss (but reject) the possibility that nominal subjects of EO verbs are interpreted intensionally.
- But at least for some verbs this seems to be the case: (8a) but not (8b) may be true in a world without werewolves
- (8) a. Werwölfe faszinieren Paula.  
b. Werwölfe verärgern Paula.
- Apply intensionality tests to many verbs introspectively
- Since judgments may be controversial: Truth-Value-Judgment Task

## Aktionsart

- Widely-held that the aktionsart (aka aspectual class) of a verb/VP is grammatically relevant
- All possible aktionsarts have already been proposed for EO verbs (Kailuweit 2015)
- Possible reasons: verbs are ambiguous (Arad 1998), verbs form latent subclasses (Hirsch 2018), lectal variation
- Perform experimental studies using aktionsart tests (Acceptability- or Truth-Value-Judgment Task depending on test)

- Analysis: How do the results relate to each other? How can all of this be formalised and explained?
